# The Challenge

---

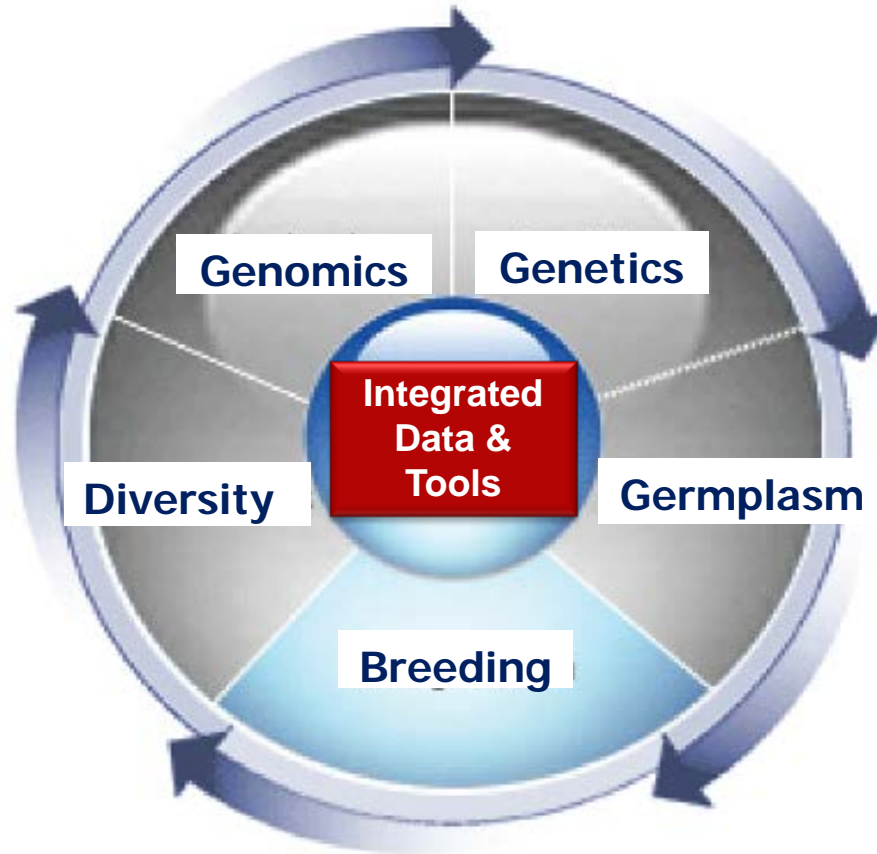

- To continue to provide high-quality online community database resources for Rosaceae, Citrus, Cotton, Cool Season Food Legumes and *Vaccinium* crops – databases that are:
  - Easy to use
  - Easy to manage and update
  - Scalable and fast
  - **Resource efficient**
  - Utilize a common, interoperable platform
  - **Self-sustaining in the medium term**
  - Easy to adopt for other underserved crops

# Integrated Data Facilitates Discovery!

---

## Basic Science

- Structure and evolution of genomes
- Gene function
- Genetic variability
- Mechanism underlying traits

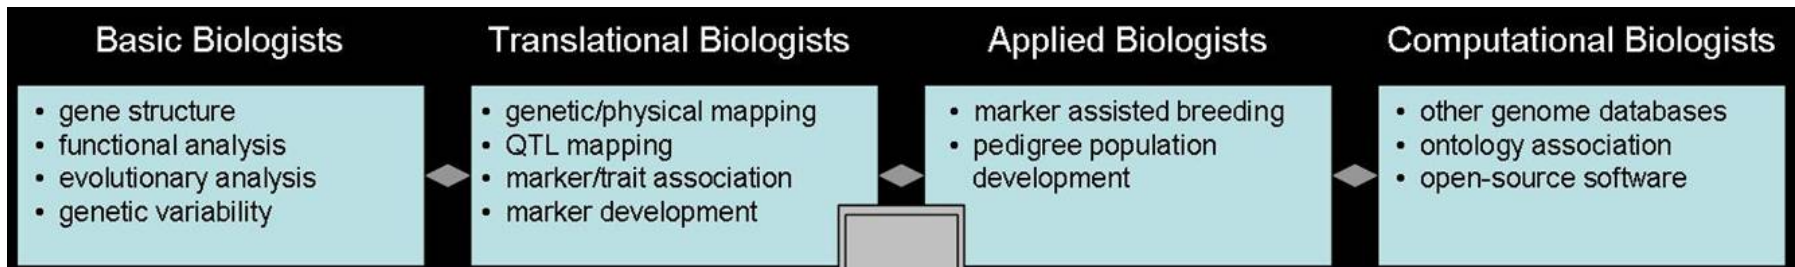

## Translational Science

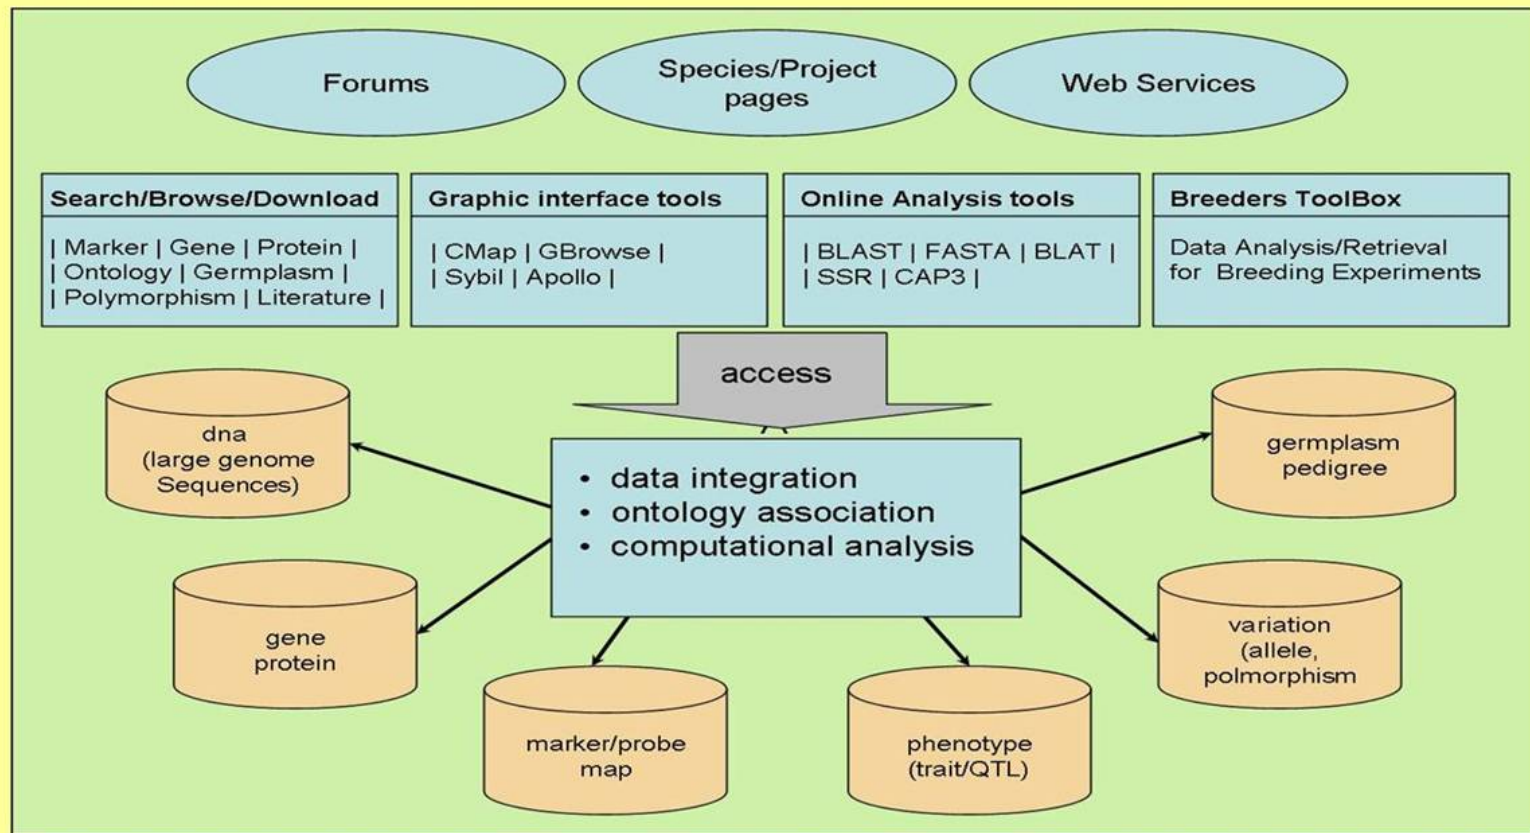

- Trait discovery
- Marker development
- Genetic mapping
- Breeding values

## Applied Science

Utilization of DNA information in breeding decisions

drupal content management

chado

# Community Databases Even More Important!

---

Recent advances in sequencing, genotyping, and phenotyping technologies have led to a paradigm shift in crop science research – “Big Data” driven

## Individual scientists now routinely

- Sequence and genotype genomes from populations, families, individuals of interest
- Pursue large-scale gene expression studies
- Create highly saturated genetic maps
- Identify genome wide loci influencing traits of interest
- Conduct large-scale standardized phenotyping.

# Why These Crops?

---

# Vision

---

- Enable basic, translational and applied crop research by expanding existing online databases currently housing high-quality genomics, genetics and breeding data for Rosaceae, Citrus, Cotton, Cool Season Food Legumes and Vaccinium crops – **underserved crops**
- Provide a complete open-source, flexible, database solution – **Tripal**
- Develop a model for long term sustainability of community databases – **Stakeholder driven and supported**

# Database Solution

---

Content Management System

Drupal modules as web front-end for Chado

Generic Database schema

## Database tool

# The Chado Natural Diversity module: a new generic database schema for large-scale phenotyping and genotyping data

## Tripal

Tripal is a collection of open-source freely available Drupal modules and is a member of the GMOD family of tools. Tripal serves as a web interface for the GMOD Chado database and is designed to allow anyone with genomic data to quickly create an online genomic database using community supported tools. Tripal is licensed under the GNU General Public License version 2.

Sites currently using Tripal:

- [Banana Genome Hub](#)
- [Cacao Genome Database](#)
- [Citrus Genome Database](#)
- [Cool Season Food Legume Genome Database](#)
- [CottonGen](#)
- [Fagaceae Genomics Web](#)
- [Genome Database for Rosaceae](#)
- [Genome Database for Vaccinium](#)
- [Hardwood Genomics Project](#)
- [KnowPulse: Pulse Crop Genomics & Breeding](#)
- [Legume Information System](#)
- [PeanutBase](#)

Send an email to the Tripal mailing list if you would like your Tripal/Drupal/Chado site listed above!

## Home Page of Kate Evans' Breeding Program

[View](#)[Edit](#)

Page Home Page of Kate Evans' Breeding Program has been updated.

## Breeding Program Outline

The Washington State University apple breeding program began in 1994 to develop new varieties suitable to the unique climate of central Washington. Washington is the leading apple producing state with over 50% of U.S. production. Unfortunately, many of the new varieties developed in the world are not well adapted to growing conditions in central Washington or available to the majority of Washington growers.

The goal is to produce apples of a high eating quality with particular factors of outstanding flavor, texture and juiciness. The breeding program is a traditional breeding program, hybridizing parents with desirable traits. Promising seedlings are selected from large populations and their fruit is evaluated in the laboratory for eating quality and suitability for long-term storage. This program is one of the 12 core US breeding programs of the SCRI RosBREED project, enabling the application of marker-assisted breeding within the 4 years of the project.

# Specific Objectives

---

1. Expand online community databases currently housing high quality genomic, genetic and breeding data for Rosaceae, citrus, cotton, cool season food legumes and *Vaccinium* crops
2. Develop/Implement a tablet application to collect phenotypic data from field and laboratory studies
3. Develop a Tripal Application Programming Interface for building breeding databases
4. Convert GenSAS, a community genome annotation tool, to Tripal
5. Develop Web Services to promote database interoperability

# Tripal Databases Sustainability

---

- Database development consists of two components
  - Core development activities
  - Data analysis and curation activities
- Database costs can be split into 4 types
  - Core development (developers, db/sys administrators)
  - Data analysis and curation (data curators)
  - Operational costs (equipment, software, space, etc.)
  - Interaction costs (investigators, travel, etc)

# Tripal Databases Sustainability Model

---

- Core database developer salaries funded by NRSP for 5 years, benefits funded by WSU
- Data curators salaries and benefits funded by stakeholders (commodity commissions, grants, etc) - **Steering Committee Input**
- Curator/analyst positions can be located anywhere
- Other orphan crops can buy into this model or implement a Tripal database themselves (and we will provide support)
